

Nedap has been developing, producing and marketing automated concepts for pig management for over 35 years now. Nedap proposes intelligent and sustainable solutions for all domains of pig management, which enables a unique approach to pigs accommodated in large group housing.

Electronic identification enables the identification, tracking and care of each and every individual pig. Whether you require feed, sorting and separation, weighing or automated heat detection systems. As a result, pig breeders can now keep their stock in large groups while ensuring the care of each individual animal. This contributes to getting better technical results, with less effort! When it comes to the animals, they benefit from better care, feed and individual pens. This is how we create the perfect balance between healthy growth, work, profit and well-being.

## NEDAP INDIVIDUAL PIG MANAGEMENT

Nedap's electronic animal identification enables efficient and smart solutions for individual pig management in the entire production cycle.

- Electronic Sow Feeding
- Sow Separation
- Sow Heat Detection
- Weight Monitoring **NEW**
- Farrowing & Breeding Stall Feeding
- Pig Sorting
- Pig Performance Testing

# Nedap Individual Pig Management

## Electronic Sow Feeding

More piglets per sow per year

**Retrofit for existing sow buildings**

Nedap ESF is a complete barn concept that combines group gestation with:

- Unique pen design to promote sow movement and use space efficiently
- Individual feeding to support optimal body condition and productivity
- Automated separation and heat detection
- Automated weight monitoring provides real-time data for feeding decisions

**Nedap Weight Monitoring** **NEW**

Nedap adds weight monitoring to ESF for added feeding accuracy. First-of-its-kind scale addition improves ability to feed to weight in gestation facilities.

## Pig Sorting

All pigs at target weight

Nedap Sorting enables the farmer to keep finishers in large groups and still manage them individually. The system guides the pigs to the correct type of feed or to delivery based on their weight. This saves time and improves production results, because the farmer always has an overview of each pig's weight and activity. So the pigs can be sent to the slaughterhouse at precisely the right time, therefore increasing the farmer's profits.

- More kilos sold
- Accurate days-to-market forecasts
- Automated sorting for delivery

## Farrowing & Breeding Stall Feeding

Heavier piglets at weaning

Nedap Farrowing & Breeding Stall Feeding automatically feeds sows in the farrowing and breeding stall according to their individual needs. Divided over several portions per day, the system dispenses the right quantity to suit the condition of the sow, the stage of lactation, the litter size and the expected farrowing date. This saves time and feed and also helps improve the sow's condition, ensuring better results in the next parity.

- Automated precision feeding - 24/7
- Ideal body condition
- Earlier in heat, higher farrowing rate

## Pig Performance Testing

Secured individual data collection

With each visit to the Nedap Pig Performance Testing station a precise measurement is taken of the animal's weight and the feed intake is recorded of the individual pig. This allows you to consistently collect reliable data for your genetics program or field trials. This valuable information can be used to select the most efficient animals for the operation.

- Ranking the pigs
- Detailed feed intake data
- Accurate weight development
